

GRADE 6 | DAY 9

FRIDAY, SEPTEMBER 4, 2026

TODAY'S GOAL

Use precise vocabulary and complete explanations while continuing normal Grade 6 progression.

Finish the week with independent evidence of what you can do now.

Breaks and lunch are built into the schedule.

Time	Lesson
9:00-9:50	Science - light filters and available wavelengths
9:50-10:00	BREAK
10:00-11:00	Mathematics - percent applications (10-question set)
11:00-11:10	SNACK / BREAK
11:10-11:50	French - etre/avoir decision practice + negative de
11:50-12:30	History - Persian Wars: rival poleis, common defense
12:30-1:15	LUNCH
1:15-2:00	Literature - comparing two arguments
2:00-2:10	BREAK
2:10-2:50	Writing - argument paragraph with evidence and counterclaim
2:50-3:30	Computer Science / AI - test accuracy and evaluation
3:30-3:40	BREAK
3:40-4:05	Art / Design - percent infographic
4:05-4:15	Weekly closeout - Started -> Finished -> Checked -> Filed

9:00

THURSDAY FEEDBACK

Read once, then begin Science.

WHAT YOU DID WELL

History: direct and representative democracy were compared accurately, including the limits of Athenian participation.

Math: benchmark percents were strong. You correctly found 10%, 25%, and 50% of several quantities.

Science: your color-and-light explanations improved; you now use available light, reflection, and absorption more accurately.

Literature: motivation and conflict were identified from dialogue and stage directions.

Writing: your evidence is becoming more specific and your reasoning is clearer.

CS/AI: you now recognize strong versus weak generalization and can identify overfitting from training/test performance.

KEEP SHARPENING

Math: $18\% = 0.18$. Keep fraction-decimal-percent conversions precise.

French: descriptions use *etre*; possession uses *avoir*. In negative possession, use *de*: *Je n'ai pas de livre*.

Writing: avoid repeating the same reason several times; each sentence should add new information.

CS/AI: test data must be kept separate so the evaluation measures performance on examples the model did not train on.

9:00-9:50

SCIENCE 6 - LIGHT FILTERS

A filter changes which wavelengths are available to pass through.

WORDS YOU NEED TODAY

filter - a material that transmits some wavelengths of light more than others

transmit - allow light to pass through

absorb - take in light energy

available light - the wavelengths/colors present before light reaches an object

selective transmission - letting some wavelengths through more strongly than others

prediction - what you expect to happen based on a model

LISTEN FIRST - VOICE TUTOR PROMPT

Teach filters as selective transmitters. Connect to Thursday's idea of available light: a red filter transmits more red light and absorbs much of the other visible light. Work three examples before practice: white light through a red filter; a red object viewed through a blue filter; a white card illuminated by light that has passed through a green filter. Make Atticus name what light is available after the filter before predicting what the object will look like.

WORKED EXAMPLE 1

White light -> red filter: mostly red light is transmitted, so the light leaving the filter looks red.

WORKED EXAMPLE 2

White card under green-filtered light: green light is available and the white card reflects it, so the card can look green.

WORKED EXAMPLE 3

Red object under blue-filtered light: little red light is available to reflect, so the red object may look dark.

1. White light passes through a blue filter. Which color of light is transmitted most strongly?

2. A white sheet of paper is illuminated only by blue-filtered light. Why can the paper look blue?

3. A red apple is illuminated only by green-filtered light. Why might the apple look dark?

4. Explain the difference between selective reflection by an object and selective transmission by a filter.

5. Predict what happens when white light passes through a red filter and then shines on a red card. Explain using available light and reflection.

EXIT TICKET

E1. What does a colored light filter do to the wavelengths in white light?

E2. Why must you know the color of the light source before predicting an object's appearance?

10:00-11:00

MATHEMATICS 6 - PERCENT APPLICATIONS

Part, whole, and percent - 10 independent questions.

WORDS YOU NEED TODAY

percent - a rate per 100

part - the portion being considered

whole - the complete quantity

benchmark percent - a familiar percent such as 10%, 25%, 50%

discount - an amount subtracted from an original price

equivalent - equal in value even when written differently

LISTEN FIRST - VOICE TUTOR PROMPT

Review the exact conversion $18\% = 18/100 = 0.18$, then extend beyond benchmark percents. Teach three strategies: convert percent to decimal, build from 10%/5% benchmarks, and use a proportion out of 100. Work three complete examples: 15% of 80 = 12; 30% of 70 = 21; 18 is 30% of 60. Then Atticus completes the 10-question set independently. Require units in word problems and reasonableness checks.

WORKED EXAMPLE 1

15% of 80: 10% is 8 and 5% is 4, so 15% is 12.

WORKED EXAMPLE 2

30% of 70: $0.30 \times 70 = 21$.

WORKED EXAMPLE 3

18 is 30% of what whole? Since $30\% = 0.30$, $18 \div 0.30 = 60$.

10-question Math set

1. Write 37% as a fraction with denominator 100 and as a decimal.

2. Write 0.64 as a percent and as a fraction with denominator 100.

3. Find 15% of 80.

4. Find 30% of 70.

5. Find 60% of 45.

6. 12 is what percent of 48? Show your reasoning.

7. 18 is 30% of what whole? Show your reasoning.

8. A \$50 jacket is discounted by 20%. Find the discount amount and the sale price.

9. Which is larger: 40% of 60 or 30% of 90? Calculate both.

10. Explain why 25%, 0.25, and $\frac{25}{100}$ name the same value.

WORKSPACE

HUNDRED GRIDS - MATH

Use if a visual model helps.

11:10-11:50

FRENCH 6 - ETRE OR AVOIR?

Decide the meaning first, then conjugate.

WORDS YOU NEED TODAY

description - what someone or something is like

possession - having or owning something

etre - to be

avoir - to have

negation - ne...pas or n'...pas

de after negation - many un/une/des possession phrases become de after ne...pas

LISTEN FIRST - VOICE TUTOR PROMPT

Keep the focus narrow and oral-first. Before every answer, ask: 'Is this a DESCRIPTION/STATE or POSSESSION?' Model: Elles sont heureuses; Elles ont deux chiens; Je n'ai pas de livre; Je ne suis pas fatigüe. Correct the exact common confusions: ont vs sont, avez vs etes, and pas de in negative possession.

WORKED EXAMPLE 1

Vous etes fatigües. = You are tired. Description -> etre.

WORKED EXAMPLE 2

Vous avez trois livres. = You have three books. Possession -> avoir.

WORKED EXAMPLE 3

Elle a une calculatrice. -> Elle n'a pas de calculatrice.

1. Choose etre or avoir and conjugate: Elles _____ heureuses.

2. Choose etre or avoir and conjugate: Vous _____ trois cahiers.

3. Choose *etre* or *avoir* and conjugate: Ils _____ fatigues.

4. Make negative: J'ai un livre.

5. Make negative: Nous avons des devoirs.

6. Make negative: Elle a une calculatrice.

7. Answer in a complete French sentence: Est-ce que tu es fatigué aujourd'hui?

8. Answer in a complete French sentence: Est-ce que tu as des devoirs aujourd'hui?

ORAL CHECK

Say eight short sentences: four descriptions with *etre* and four possession sentences with *avoir*. Make three possession sentences negative using *de*.

11:50-12:30

HISTORY - PERSIAN WARS

Rival Greek poleis cooperate against an outside threat.

WORDS YOU NEED TODAY

Persian Empire - a large empire that controlled territories across parts of Asia, Africa, and Europe

invasion - an organized entry of armed forces into another territory

alliance - an agreement to cooperate for a shared purpose

strategy - a plan for achieving a goal

naval - related to ships or warfare at sea

significance - why an event matters in a larger story

LISTEN FIRST - VOICE TUTOR PROMPT

Teach a concise, chronological overview of the Persian Wars at Grade 6 level. Greece was divided into independent poleis, but some cooperated when the Persian Empire invaded. Introduce Marathon, Thermopylae, and Salamis as examples of different strategies and outcomes, without turning the lesson into memorizing dates. Emphasize the larger idea: political rivals can cooperate against a common threat and later return to rivalry.

Reading - From Rival Poleis to Common Defense

In the early fifth century BCE, the Persian Empire attempted to extend its control into the Greek world. The Greek poleis were not one country. They had separate governments and often competed with one another.

When Persian forces threatened Greece, several poleis cooperated. At Marathon, Athenian-led forces defeated a Persian army on land. Later, a small Greek force that included Spartans resisted a much larger Persian army at Thermopylae. The defenders were defeated, but their resistance delayed the Persian advance.

At sea, Athens had developed a strong navy. During the later invasion, Greek ships defeated the Persian fleet at Salamis. Geography mattered: narrow waters limited how freely the larger Persian fleet could maneuver.

The wars did not erase differences among the Greek poleis. Athens and Sparta remained politically independent and eventually became rivals again. The Persian Wars therefore show both cooperation and division in the Greek world.

1. Why was cooperation among Greek poleis notable during the Persian Wars?

2. What different kinds of military strategy are illustrated by Marathon, Thermopylae, and Salamis?

3. How did geography help the Greek fleet at Salamis?

4. What does the Persian Wars story show about the relationship between cooperation and political independence?

5. Put these events in the order presented in the reading: Salamis, Thermopylae, Marathon.

EXIT TICKET

In 3-4 sentences, explain why the Persian Wars do NOT prove that the Greek poleis had become one unified country.

1:15-2:00

LITERATURE / READING - COMPARING ARGUMENTS

Identify claim, reasons, evidence, and counterargument.

WORDS YOU NEED TODAY

claim - the main position an author wants the reader to accept

reason - an explanation supporting the claim

evidence - a fact, example, or detail supporting a reason

counterargument - an opposing viewpoint or objection

rebuttal - a response to a counterargument

credible - worthy of trust or belief

LISTEN FIRST - VOICE TUTOR PROMPT

Teach argument structure before reading: claim -> reasons -> evidence; counterargument -> rebuttal. The two short texts take different positions on individual accountability logs in group projects. Ask Atticus to identify each author's claim and the strongest reason. Make him separate a reason from an example. Do not ask whether he agrees until after he analyzes both texts.

Viewpoint A - Use Individual Accountability Logs

Group projects should include a short individual accountability log. In a team, it can be difficult to see who completed which task. A simple log makes responsibilities visible and can help a teacher distinguish between a student who contributed consistently and a student who depended on teammates. Logs can also help groups notice unfinished tasks before a deadline. Critics may say logs create extra paperwork, but a brief two-minute record is a small cost if it prevents confusion about who is responsible for what.

Viewpoint B - Do Not Require Individual Logs

Group projects should not require individual accountability logs. The purpose of teamwork is to solve a problem together, not to make every action individually measurable. Students may spend time documenting work instead of doing the work, and a written log may not capture important contributions such as explaining an idea or helping a teammate revise. If a team has problems, teachers can use checkpoints and short conferences instead. These methods keep the focus on collaboration rather than paperwork.

1. State the main claim of Viewpoint A in one sentence.

2. State the main claim of Viewpoint B in one sentence.

3. Give TWO reasons Viewpoint A uses to support its claim.

4. Give TWO reasons Viewpoint B uses to support its claim.

5. What counterargument does Viewpoint A acknowledge, and how does it respond?

6. Which reason in either text is strongest? Explain WHY that reason is strong rather than simply saying you agree with it.

EXIT TICKET

Explain the difference between a CLAIM and a REASON using one of today's viewpoints.

2:10-2:50

WRITING 6 - ARGUMENT PARAGRAPH

Claim, evidence, reasoning, counterclaim.

WORDS YOU NEED TODAY

argument - a position supported by reasons and evidence

claim - the position you are arguing for

counterclaim - a reasonable opposing position

rebuttal - your response to the counterclaim

evidence - specific support for a reason

reasoning - why the support matters to the claim

LISTEN FIRST - VOICE TUTOR PROMPT

Teach one compact Grade 6 argument structure: claim, reason 1 with evidence/reasoning, reason 2 with evidence/reasoning, counterclaim + rebuttal, conclusion. Use the two reading viewpoints as the evidence source. Model a paragraph about a different school-policy question before Atticus writes. Require one counterclaim; do not write his paragraph for him.

WORKED EXAMPLE - STRUCTURE ONLY

Claim: School clubs should publish meeting agendas. Reason: agendas help members prepare. Evidence: members can see what decisions will be discussed. Reasoning: preparation makes meetings more efficient. Counterclaim: agendas take time to write. Rebuttal: a short agenda can be created in a few minutes.

1. Choose your position: Should group projects require a short individual accountability log? Write your claim.

2. Write Reason 1 and one supporting detail from the reading.

3. Explain why that detail supports your claim.

4. Write Reason 2 and one supporting detail.

5. State one reasonable counterclaim and your rebuttal.

Final argument paragraph

Write 9-11 sentences. Include your claim, two reasons, evidence/reasoning for both, one counterclaim with rebuttal, and a conclusion. Revise sentence boundaries before you finish.

2:50-3:30

COMPUTER SCIENCE / AI - EVALUATING A TEST SET

Accuracy uses unseen test examples.

WORDS YOU NEED TODAY

test set - a group of unseen examples used to evaluate a trained model

accuracy - the fraction or percent of test examples predicted correctly

actual label - the correct category for a test example

prediction - the category chosen by the model

error pattern - a repeated type of mistake

evaluation - measuring how well a model performs

LISTEN FIRST - VOICE TUTOR PROMPT

Build on Thursday's understanding of overfitting. Introduce accuracy as correct predictions divided by total test examples. Use a 10-example test set so the percent is transparent. Model 8 correct out of 10 = 80%. Then have Atticus compare predictions with actual labels and identify one error pattern. Reinforce that the test examples must be unseen during training.

WORKED EXAMPLE 1

8 correct predictions out of 10 test examples = $8/10 = 80\%$ accuracy.

WORKED EXAMPLE 2

A model can have high training accuracy and lower test accuracy. Test accuracy tells us more about performance on new examples.

Test-set table

#	Actual	Prediction	Correct?
1	Cup	Cup	
2	Book	Book	
3	Pencil	Pencil	

4	Cup	Book	
5	Book	Book	
6	Pencil	Pencil	
7	Cup	Cup	
8	Book	Cup	
9	Pencil	Pencil	
10	Cup	Cup	

1. Mark each prediction correct or incorrect in the table.

2. How many of the 10 predictions are correct?

3. What is the test accuracy as a fraction and as a percent?

4. Which actual class was confused with another class more than once, if any? Describe the error pattern.

5. Why would it be unfair to include these exact 10 test images in the training data before computing this accuracy?

EXIT TICKET

- E1. Define test accuracy in one sentence.
- E2. If a model gets 18 correct out of 20 unseen test examples, what is its accuracy?

3:40-4:05

ART / DESIGN - PERCENT INFOGRAPHIC

Turn a number into a clear visual explanation.

WORDS YOU NEED TODAY

infographic - a visual that combines information, numbers, and design

visual hierarchy - the order in which a viewer notices information

data label - text identifying a value or category

contrast - a visible difference that helps information stand out

annotation - a short explanatory note

LISTEN FIRST - VOICE TUTOR PROMPT

Help Atticus design a one-page infographic that explains ONE percent fact from today's Math. He may use a hundred grid, a large percent numeral, a small illustration, and a short caption. Ask what the viewer should notice first, then what visual proves the percentage. Do not design the piece for him.

1. My percent fact:

2. What should the viewer notice first?

3. What visual will show the part and the whole?

4. Write a 2-sentence caption that explains the percent accurately.

Final piece: clear title, one large percent value, a visual showing part and whole, at least two useful labels, a 2-sentence caption, name + date.

4:05-4:15

FRIDAY / WEEK CLOSEOUT

Started -> Finished -> Checked -> Filed

NOTHING MISSING CHECK

Science questions + exit

Math 10-question set

French practice + oral check

History reading questions + exit

Literature argument analysis + exit

Writing argument paragraph

CS/AI test-set evaluation + exit

Art/Design percent infographic

One thing I understand better this week:

One glossary word I can define without looking:

One skill I want to make stronger next week:

One question I still have:

Friday glossary - quick reference

Subject	Term	Meaning
Science	filter	material that transmits some wavelengths more than others
Math	percent	rate per 100
Math	discount	amount subtracted from an original price
French	possession	having or owning something
History	alliance	agreement to cooperate for a shared purpose
Reading	counterargument	opposing viewpoint or objection
Writing	rebuttal	response to a counterclaim
CS/AI	accuracy	fraction or percent of test examples predicted correctly

Thursday evidence used

Math benchmark percents were strong; conversion precision and broader percent applications are next. Science color reasoning is strong enough to move to filters. History democracy comparison is secure enough to progress chronologically. Literature motivation is improving; Friday shifts genre to argument analysis. French remains focused on *être/avoir* and negative *de*. CS/AI is ready for test-set accuracy after improved overfitting/generalization reasoning.

Science: 1 blue. 2 white paper reflects the available blue light. 3 little/no red light available; green may be absorbed. 4 reflection occurs at object; transmission through filter. 5 red filter supplies red light, red card reflects it strongly.

Math: 1 $37/100$, 0.37 . 2 64% , $64/100$. 3 12. 4 21. 5 27. 6 25% . 7 60. 8 \$10 discount, \$40 sale price. 9 24 vs 27, so 30% of 90 is larger. 10 all equal one fourth.

French: 1 sont. 2 avez. 3 sont. 4 Je n'ai pas de livre. 5 Nous n'avons pas de devoirs. 6 Elle n'a pas de calculatrice. 7 likely Je ne suis pas fatigué aujourd'hui. 8 varies.

History: Order: Marathon, Thermopylae, Salamis. Main idea: separate poleis cooperated against Persia but did not become one unified state.

Literature: A claim is the position; reasons explain why. Viewpoint A reasons: visible responsibilities, early detection of unfinished tasks. Viewpoint B reasons: paperwork may distract, logs may miss invisible contributions. A acknowledges extra paperwork and rebuts that a short log is worth the cost.

Writing: Evaluate claim clarity, use of two source-based reasons, evidence/reasoning, counterclaim/rebuttal, and mechanics separately.

CS/AI: Rows incorrect: #4 and #8. $8/10$ correct = 80% . Error pattern includes Cup/Book confusion in two directions, not one repeated actual-class error. $18/20$ = 90% .

Art: Check percent accuracy and whether visual clearly shows part vs whole; do not score artistic polish above clarity.
